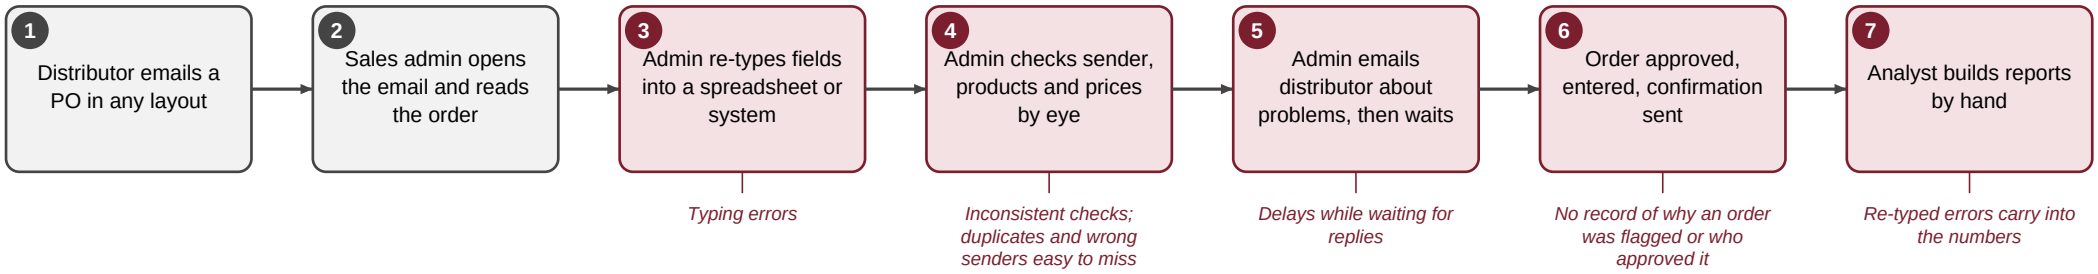
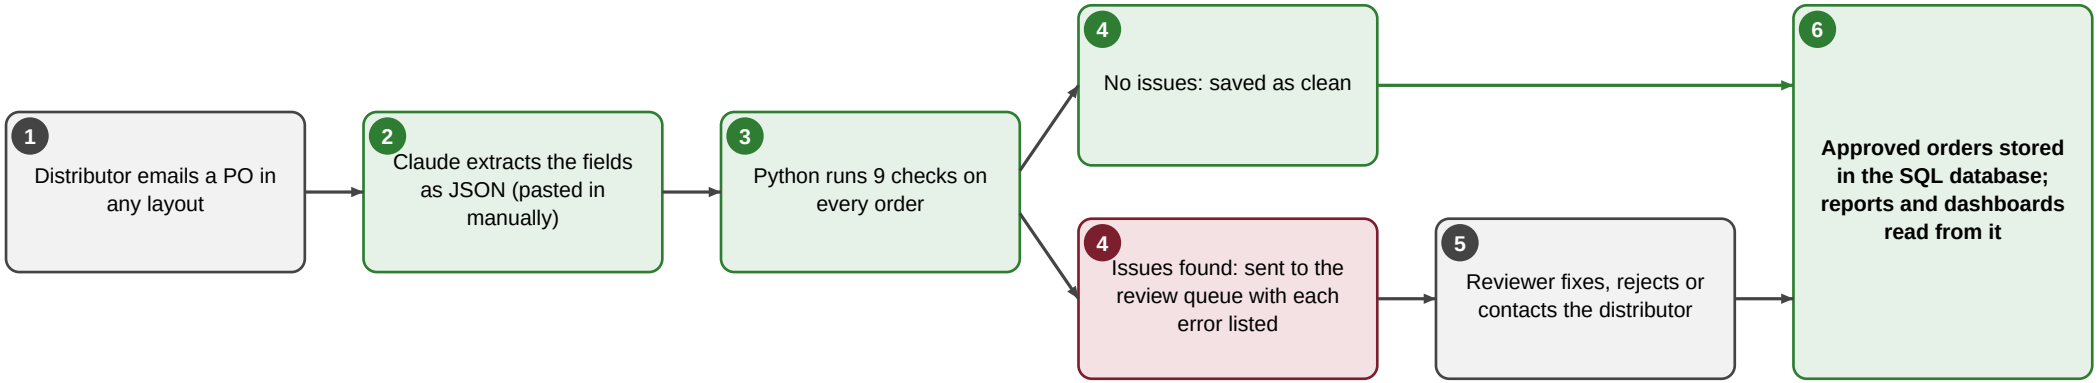
OrderFlow: purchase order process, current vs improved

Portfolio project, fictional data. The current-state steps are a typical manual process (assumed, not measured).

CURRENT STATE: manual process



IMPROVED STATE: OrderFlow (AI-assisted extraction, automatic checks, human review of exceptions)



WHAT CHANGES

Re-typing -> AI-assisted extraction

No record -> exceptions table that shows each issue per order

Checks by eye -> 9 automatic rules, applied the same way every time

Reports from re-typed data -> SQL queries on stored orders

Result on my development set: 8 of 8 planted errors caught, 0 false alarms. Time savings were not measured. Extraction stays a manual step to keep the project free.
